

MetaFix™ collared gains 510k approval

1 February 2016

Corin is pleased to announce the 510k approval in the US for an additional range of stem options for their flagship MetaFix™ (HA) hip stem system.

This innovative stem system is based on a long-term proven design philosophy and with the recent approval in the US now has the option of a full range of 'Collared Stems' and unique option of 'Short Neck' variants to provide a truly customised approach to individual patient anatomical variations.

The newly approved hip range offers significant benefits over its major competitors in particular with narrower collar footprint in the A/P plane and progressive collar growth to further enhance patient fit throughout the range.

"Completing the MetaFix™ portfolio will further expand Corin's presence and portfolio in the US. It also enables Corin to advance its direct anterior approach (DAA) educational programs in the US and globally.

Many surgeons using DAA are interested in the MetaFix™ product line." said Paul Berman, Corin's President of US Operations.
